

Domain Systems' Oracle-Agile to OrCAD/CIS Application Adapter seamlessly transfers information between Agile and OrCAD. The adapter allows OrCAD users to search and retrieve parts from Agile directly within an OrCAD session.

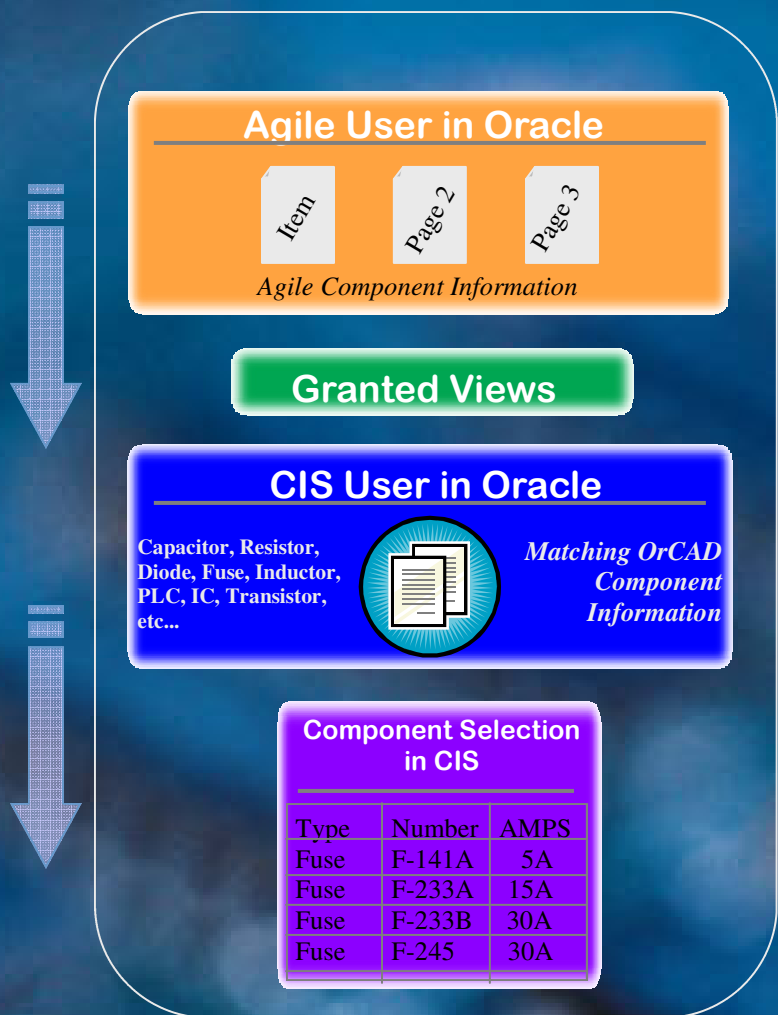

Components from Agile's item master are presented to the OrCAD designer via CIS through an ODBC connection to the Agile database. The component views are custom configured for the customer and can include:

- Title Block Information
- Page 2 Information
- Page 3 Information

Views can also include any type of attribute field in Agile except multi-list fields. Views can also be presented as a single table containing all components or as individual tables corresponding to the discrete component subclasses configured in Agile.

- Search and retrieve parts via Agile directly within an OrCAD session.
- Perform component selection from CIS with custom views using Agile component subclasses
- From CIS selected component view, can open Agile web client for part and attachments information in Agile PLM
- Views can include most any type of attribute field from Agile
- Views will be presented as individual tables corresponding to customer defined component types

Agile to OrCAD/CIS Application Adapter

- All component information is mastered in Agile. No duplicate component library information
- Dynamic Views allow component selection the moment a component is released
- Views are highly configurable and tailored to customer requirements
- Accurate data exchange with instant error notification
- Reliable and easy to use
