

Domain Systems – ChangeCAST/BOM Post Adapter

Retrieve the BOM Item Revision from Agile for the ERP

Some ERP systems require BOM item revisions in order to create a BOM record. With Domain Systems' BOM Post Adapter, Agile ChangeCAST customers are able to retrieve the BOM item revision from Agile for their own ERP. The BOM Post Adapter intercepts the Agile/ChangeCAST process and retrieves the BOM item revision directly from Agile using the latest Agile 6/SDK technology. It also builds and transfers the new file to the ERP system.

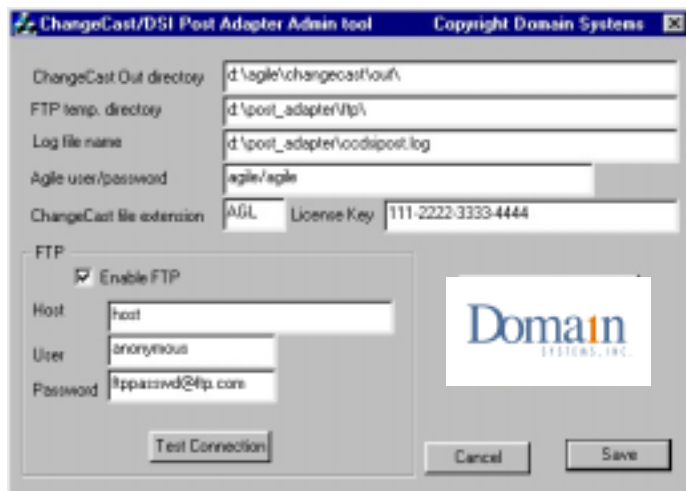

The post adapter has no run-time user interface and runs in batch mode or from ChangeCAST. The BOM Post Adapter will:

1. Read the ChangeCAST AGL file and determine if it contains BOM information.
2. Retrieve and store BOM item revision for every BOM item in the new AGL file.
3. Transfer new AGL file to the ERP system via FTP.

The adapter transfers the files to any ERP system set up for FTP. It runs on a NT Agile 6 server running Change/CAST. It is built around the Agile/SDK MFC technology.

The BOM Post Adapter comes with an admin tool to help configure the adapter's run-time setting. The adapter's logging capability keeps track of all error messages.

Key Benefits

- Productized integration for retrieving BOM Item revision data from Agile
- Saves time and eliminates errors while transferring critical data to ERP
- Reliable and easy to use
