

Domain Systems – Universal Batch Update Adapter

Update Agile’s Title Block, Page 2 and Page 3 Information

Domain Systems’ Universal Batch Update Adapter is for customers who need to transfer information from any external system into Agile but do not want to customize and maintain an interface for a specific external system.

The Universal Adapter processes files from the external system then updates Agile with critical item information such as ERP cost information, product lines, and/or other related system data.

The Universal Adapter uses the latest Agile SDK technology which helps to ensure future compatibility.

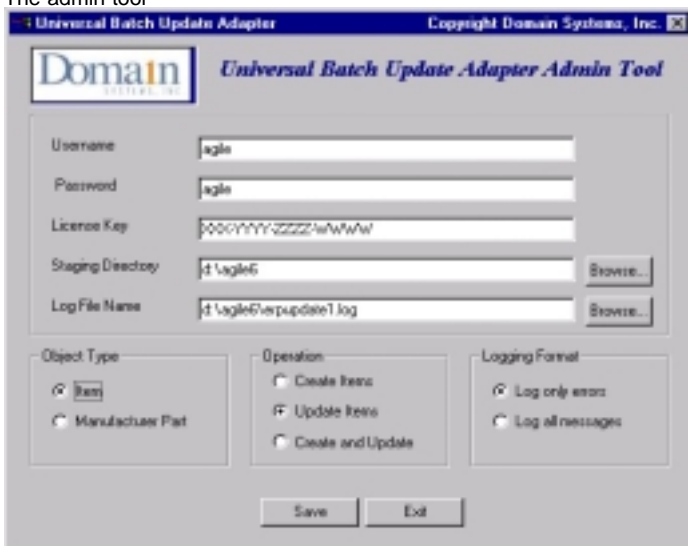

The Universal adapter has no run-time user interface and runs in batch mode. It updates existing item master records or creates new items in Agile depending on user-configured options.

The Universal adapter works with any external system (ERP, CAD, etc.) as long as the system can produce a text delimited extract file.

The Universal adapter runs on a NT Agile server and it is built around the Agile SDK/MFC technology.

The universal adapter comes with an admin tool to help configure the adapter’s run-time settings. The adapter’s logging capability keeps track of all error messages.

The admin tool

Key Benefits

- Eliminates the need for custom code to transfer information into Agile
- Open architecture allows communication via any system that can extract a text-delimited file
- Saves time by eliminating manual interaction and the introduction of costly errors
- Reliable and easy to use
