

Domain Systems – PDX Generator (PDXGen) Utility

Convert Customer Data to PDX Packages

PDXGen provides a simple and affordable solution to generate and manage product data in industry standard format (PDX). It reads and converts your data into PDX format or can be configured to convert PDX format data into your desired formats.

With PDXGen you can view and manage your product data through its intuitive and easy to use GUI. PDXGen assists product data professionals with tools for management of complicated product data.

PDXGen is engineered to be a utility for low cost Product Data eXchange and product data management. PDXGen creates and manages PDX packages converting product definition data in different formats to PDX format. PDXGen also ensures product data integrity and accuracy.

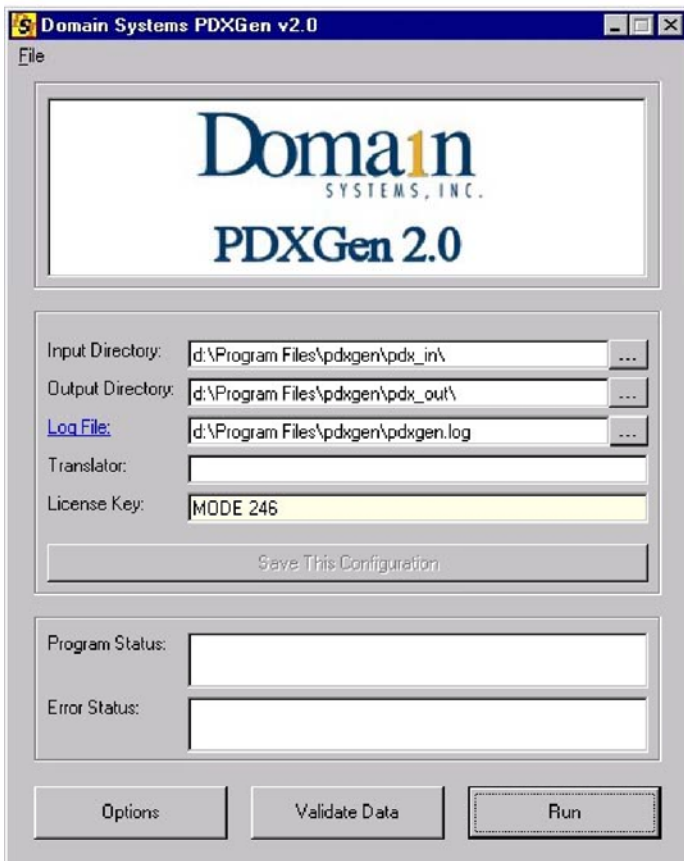

Outside of the enterprise, your business partners can exchange product contents in same industry-standard format while they can still work with their preferred data formats without making unnecessary investment in expensive exchange systems.

In the Agile world, PDXGen reads customer data files of Item Master, AML and BOM records and converts them to PDX packages in compliance with PDX standards.

The PDXGen utility is designed to help leverage Agile's import tool functionality allowing customers to convert legacy data or CAD files into PDX format for import into Agile.

The utility reads product related data from a set of text files (referred to as a job) and formats the data into a PDX package. Each job is contained in a separate directory that is named for the PDX package being processed. Once completed, the PDX package is given the name of the job subdirectory and placed into the output directory. The utility's logging capability keeps track of all error messages during the conversion process.

PDX, is an XML-based open industry standard for Product Data eXchange. It is widely adopted by the manufacturing community to serve as the common ground for Product Data eXchange. It addresses the complexity associated with Product Data eXchange and Bills of Material (BOM) management.

Key Benefits

- Eliminates the need for custom code to import data into your PLM system
- Saves time and eliminates common errors associated with manual data importing
- Leverages the new Agile import tool
- Reliable and easy to use
- Can be integrated directly into your databases or ERP/MRP or CAD systems
- Converts customer product data into PDX format

Available exclusively through Domain Systems
